**Warning**
Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

2. Limited warranty

Products manufactured by GRUNDFOS PUMPS CORPORATION (Grundfos) are warranted to the original user only to be free of defects in material and workmanship for a period of 24 months from date of installation, but not more than 30 months from date of manufacture. Grundfos' liability under this warranty shall be limited to repairing or replacing at Grundfos' option, without charge, F.O.B. Grundfos' factory or authorized service station, any product of Grundfos' manufacture. Grundfos will not be liable for any costs of removal, installation, transportation, or any other charges which may arise in connection with a warranty claim. Products which are sold but not manufactured by Grundfos are subject to the warranty provided by the manufacturer of said products and not by Grundfos' warranty. Grundfos will not be liable for damage or wear to products caused by abnormal operating conditions, accident, abuse, misuse, unauthorized alteration or repair, or if the product was not installed in accordance with Grundfos' printed installation and operating instructions.

To obtain service under this warranty, the defective product must be returned to the distributor or dealer of Grundfos' products from which it was purchased together with proof of purchase and installation date, failure date, and supporting installation data. Unless otherwise provided, the distributor or dealer will contact Grundfos or an authorized service station for instructions. Any defective product to be returned to Grundfos or a service station must be sent freight prepaid; documentation supporting the warranty claim and/or a Return Material Authorization must be included if so instructed.

GRUNDFOS WILL NOT BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, LOSSES, OR EXPENSES ARISING FROM INSTALLATION, USE, OR ANY OTHER CAUSES. THERE ARE NO EXPRESS OR IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHICH EXTEND BEYOND THOSE WARRANTIES DESCRIBED OR REFERRED TO ABOVE.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages and some jurisdictions do not allow limit actions on how long implied warranties may last. Therefore, the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from jurisdiction to jurisdiction.

4. General information

These installation and operating instructions apply to the Grundfos TPE2 (D) and TPE3 (D) pumps. The pumps are fitted with frequency-controlled permanent-magnet motors for single-phase or three-phase power supply connection.

4.1 Radio communication

This product incorporates a radio module for remote control which is a class 1 device and can be used anywhere in the EU member states without restrictions. For use in USA and Canada, see page 50.

Warning

TPE2 D, TPE3 D: The centrally positioned thread of the pump housing must not be used for lifting purposes as the thread is placed below the center of gravity of the pump.

Lift the pump by means of nylon straps. See figs 1 and 2.
6. Applications
The pumps are designed to circulate hot or cold water in:
• heating systems
• district heating plants
• air-conditioning systems
• cooling systems.
In addition, the pumps are used for liquid transfer and water supply in:
• washing systems
• domestic hot-water systems
• industrial systems in general.
To ensure optimum operation, the sizing range of the system must fall within the performance range of the pump.

6.1 Pumped liquids

**Warning**
*If the pump is used for a liquid which is hazardous, it will be classified as contaminated. In such cases, the proper precautions must be taken to avoid injury to health when operating or working on the pump.*

The pump is suitable for thin, clean, non-aggressive and nonflammable liquids, not containing solid particles or fibers that may attack the pump mechanically or chemically.

Examples:
• central heating system water (the water should meet the requirements of accepted standards on water quality in heating systems)
• cooling liquids
• domestic hot water
• industrial liquids
• softened water.

The pumping of liquids with a density and/or kinematic viscosity higher than that of water will cause the following:
• a considerable pressure drop
• a drop in hydraulic performance
• a rise in power consumption.
In such cases, fit the pump with a bigger motor. If in doubt, contact Grundfos.
The EPDM O-rings fitted as standard are primarily suitable for water.
If the water being pumped contains minerals, synthetic oil, chemicals, or any liquids other than water, choose the O-rings accordingly.

7. Operating conditions

7.1 Maximum number of starts and stops
The number of starts and stops via the power supply must not exceed four times per hour.
When switched on via the power supply, the pump will start after approx. 5 seconds.
If you want a higher number of starts and stops, use the input for external start/stop when starting/stopping the pump.
When started via an external on/off switch, the pump will start immediately.

7.2 Alternating operation of twin-head pumps
On twin-head pumps, the duty and backup pumps must be alternated on a regular basis, i.e. once a week, to ensure an even distribution of the operating hours on both pumps. As default, the pumps alternate automatically. See section 16.1 Multi-pump setup.
If you use twin-head pumps for pumping domestic hot water, the duty and backup pumps must be alternated on a regular basis, i.e. once a day, to avoid blocking of the backup pump due to deposits (calcareous deposits, etc.). As default, the pumps alternate automatically. See section 16.1 Multi-pump setup.

7.3 Liquid temperature
-13 °F (-25 °C) up to 248 °F (+120 °C).
The maximum liquid temperature depends on the mechanical shaft seal type and the pump type.
Depending on the cast-iron version and the pump application, the maximum liquid temperature may be limited by local regulations and laws.
The maximum liquid temperature is stated on the pump nameplate.

**Note**
*If the pump is operating with liquids at high temperatures, the life of the shaft seal may be reduced. It may be necessary to replace the shaft seal more often.*

7.4 Ambient temperature

7.4.1 Ambient temperature during storage and transportation
-22 to 140 °F (-30 to +60 °C).

7.4.2 Ambient temperature during operation
-4 to 122 °F (-20 to +50 °C).
The motor can operate with the rated power output (P2) at 122 °F (50 °C), but continuous operation at higher temperatures will reduce the expected product life. If the motor is to operate at ambient temperatures between 122 and 140 °F (50 and 60 °C), select an oversized motor. Contact Grundfos for further information.

7.5 Operating pressure/test pressure
The pressure test has been made with water containing anti-corrosive additives at a temperature of +68 °F (+20 °C).

<table>
<thead>
<tr>

<td>15 218</td>
</tr>
</tbody>
</table>
7.6 Inlet pressure
To ensure optimum and quiet pump operation, the inlet pressure (system pressure) must be adjusted correctly. See table on page 51.
For the calculation of specific inlet pressures, contact the local Grundfos company or see the data booklet for TP(D), TPE(D), TPE2 (D) and TPE3 (D) on www.grundfos.us.

7.7 Electrical data
For specific motor data, see the motor nameplate.

7.8 Sound pressure level
The sound pressure level of the pump is lower than 70 dB(A).

7.9 Environment
Non-aggressive and non-explosive atmosphere.

7.10 Installation altitude

Caution The motor must not be installed more than 6562 ft (2000 m) above sea level.

Installation altitude is the height above sea level of the installation site.
• Motors installed up to 3281 ft (1000 m) above sea level can be loaded 100 %.
• Motors installed more than 3281 ft (1000 m) above sea level must not be fully loaded due to the low density and consequent low cooling effect of the air. See fig. 3.

7.11 Air humidity
Maximum air humidity: 95 %.
If the air humidity is constantly high and above 85 %, one of the drain holes in the drive-end flange must be open. See section 5. Delivery and handling.

7.12 Motor cooling
To ensure cooling of motor and electronics, observe the following:
• Position the motor in such a way that adequate cooling is ensured. See section 8.7 Ensuring motor cooling.
• The temperature of the cooling air must not exceed 122 °F (50 °C).
• Keep cooling fins and fan blades clean.

Fig. 3 Derating of motor output power (P2) in relation to altitude above sea level
8. Mechanical installation

**Warning**

*When pumping hot or cold liquids, make sure that persons cannot accidentally come into contact with hot or cold surfaces.*

In order to maintain the UL mark, additional installation procedures must be followed. See page 50.

Install the pump in a dry well-ventilated, but frost-free position. When installing pumps with oval bolt holes in the pump flange, use washers as shown in fig. 4.

![Fig. 4 Use of washers for oval bolt holes](image)

**Caution**

The motor must never fall below the horizontal plane.

For inspection and removal of motor or pump head, a clearance of 11.81" (300 mm) is required above the motor. See fig. 5.

![Fig. 5 Required clearance above the motor](image)

If the liquid temperature falls below the ambient temperature, condensation may form in the motor during inactivity. In this case, make sure that one of the drain holes in the motor flange is open and points downwards. See fig. 7.

![Fig. 7 Drain hole in motor flange](image)

If twin-head pumps are used for pumping liquids with a temperature below 32 °F (0 °C), condensed water may freeze and cause the coupling to get stuck. You can solve the problem by installing heating elements. Whenever possible, install the pump with the motor shaft in horizontal position. See fig. 6.

![Fig. 6 Automatic air vent](image)

8.1 Pipework

Fit isolating valves on either side of the pump to avoid draining the system if the pump needs to be cleaned or repaired. The pump is suitable for pipeline mounting, provided that the pipes are adequately supported on either side of the pump. Single-head pumps are designed for pipeline mounting only. Twin-head pumps are prepared for installation on a mounting bracket or base plate.

When installing the pipes, make sure that the pump housing is not stressed by the pipework. The suction and discharge pipes must be of an adequate size, taking the pump inlet pressure into account. To avoid sediment build-up, do not fit the pump at the lowest point of the system. Install the pipes so that air locks are avoided, especially on the suction side of the pump. See fig. 8.

![Fig. 8 Correct pipework on the suction side of the pump](image)

The pump must not run against a closed discharge valve as this will cause an increase in temperature/formation of steam in the pump which may cause damage to the pump.

If there is any risk of the pump running against a closed discharge valve, ensure a minimum liquid flow through the pump by connecting a bypass/a drain to the discharge pipe. You can for instance connect the drain to a tank. A minimum flow rate equal to 10 % of the flow rate at maximum efficiency is needed at all times.

Flow rate and head at maximum efficiency are stated on the pump nameplate.
8.2 Terminal box positions

Warning
Before starting work on the pump, make sure that the power supply has been switched off for at least 5 minutes. Make sure that the power supply cannot be accidentally switched on.

Warning
If the pump head has been lifted partly or completely from the pump housing, pay special attention when fitting the pump head again. See 8.3 Fitting of pump head.

Warning
When loosening the clamp, do not drop the pump head. See fig. 9.

Warning
When loosening the clamp, there is a risk of escaping vapor. See fig. 9.

The terminal box can be turned to any position. Change the terminal box position as follows:
1. Loosen the clamp securing the pump head to the pump housing. See fig. 9.

Fig. 9  Clamp (A)

2. Turn the pump head to the required position.
3. Check the following before you tighten the clamp:
   – The contact face of the pump housing and that of the pump head must be in full contact.
   – Position the clamp correctly in the flange recess of both the pump head and the pump housing. See fig. 12.

   Tightening torque: 5.9 lbf-ft (± 0.75) (8 Nm (± 1)).

8.3 Fitting of pump head

Warning
Before starting work on the pump, make sure that the power supply has been switched off for at least 5 minutes. Make sure that the power supply cannot be accidentally switched on.

Warning
If the pump head has been lifted partly or completely from the pump housing, pay special attention when fitting the pump head again. See instructions below.

Warning
Do not drop the pump head. See fig. 9.

Warning
When loosening the clamp, there is a risk of escaping vapor. See fig. 9.

If for some reason the pump head has been lifted from the pump housing, follow the following procedure in order to mount the pump head correctly:
1. Visually check that the neck ring is centered in the pump housing. See fig. 10.

Fig. 10  Centering of neck ring

2. Gently lower the pump head with rotor shaft and impeller into the pump housing. See fig. 11.

Fig. 11  Lowering of pump head
3. Check the following before you tighten the clamp:
   – The contact face of the pump housing and that of the pump head must be in full contact.
   – Position the clamp correctly in the flange recess of both the pump head and the pump housing. See fig. 12.

   Tightening torque: 5.9 lbf-ft (± 0.75) (8 Nm (± 1)).

   Fig. 12 Positioning of clamp ring

8.4 Base plate
Twin-head pumps have tapped holes in the bottom of the pump housing. The holes can be used for mounting a base plate.

8.5 Insulation

   **Caution**

   Do not insulate the motor stool as this will trap any vapor escaping from the shaft seal, thus causing corrosion. Covering the motor stool with insulation will also make inspection and service difficult.

   Follow the guidelines in fig. 13 when insulating the pump.

   A

   B  C

   Fig. 13 Insulation of TPE2, TPE3 pumps

8.6 Frost protection
Pumps which are not being used during periods of frost must be drained to avoid damage.

8.7 Ensuring motor cooling

   **Note**

   In order to ensure sufficient cooling of the motor, the distance (D) between the end of the fan cover and a wall or other fixed objects must always be at least 2.0” (50 mm), irrespective of motor size. See fig. 14.

   Fig. 14 Minimum distance (D) from the motor to a wall or other fixed objects

8.8 Outdoor installation

When installed outdoors, the motor must be provided with a suitable cover to avoid condensation on the electronic components. See fig. 15.

   **Note**

   When fitting a cover to the motor, observe the guideline in section 8.7 Ensuring motor cooling.

   The cover must be sufficiently large to ensure that the motor is not exposed to direct sunlight, rain or snow. Grundfos does not supply covers. We therefore recommend that you have a cover built for the specific application. In areas with high air humidity, we recommend that you enable the built-in standstill heating function.

   Fig. 15 Examples of covers (not supplied by Grundfos)
9. Electrical installation

Carry out the electrical connection according to local regulations. Check that the supply voltage and frequency correspond to the values stated on the nameplate.

**Warning**
Before making any connections in the terminal box, make sure that the power supply has been switched off for at least 5 minutes. Make sure that the power supply cannot be accidently switched on.

The motor must be connected to an external all-pole power supply switch according to local regulations.

The motor must be grounded and protected against indirect contact in accordance with local regulations.

If the power supply cable is damaged, it must be replaced by the manufacturer, the manufacturer’s service partner or a similarly qualified person.

The user or the installer is responsible for the installation of correct grounding and protection according to local regulations. All operations must be carried out by a qualified electrician.

**Note**

9.1 Protection against electric shock, indirect contact

**Warning**
The motor must be grounded and protected against indirect contact in accordance with local regulations.

9.1.1 Protection against power supply voltage transients

The motor is protected against power supply voltage transients in accordance with EN 61800-3.

9.1.2 Motor protection

The motor requires no external motor protection. The motor incorporates thermal protection against slow overloading and blocking.

9.2 Power supply

9.2.1 Single-phase supply voltage

- 1 x 200-240 V - 10 %/+ 10 %, 60 Hz, PE.

Check that the supply voltage and frequency correspond to the values stated on the nameplate.

The wires in the motor terminal box must be as short possible except for the separated ground conductor which must be so long that it is the last one to be disconnected in case the cable is inadvertently pulled out of the cable entry.

For maximum backup fuse, see section 26.1 Supply voltage.

**Fig. 16** Example of a power supply-connected motor with power supply switch, backup fuse and additional protection

**Fig. 17** Power supply connection, single-phase motors

**Warning**
The motor must be grounded and protected against indirect contact in accordance with local regulations.

**Note**
The user or the installer is responsible for the installation of correct grounding and protection according to local regulations. All operations must be carried out by a qualified electrician.
9.2.2 Three-phase supply voltage

- 3 x 440-480 V - 10 %/+ 10 %, 60 Hz, PE.

*In order to avoid loose connections, ensure that the terminal block for L1, L2 and L3 is pressed home in its socket when the supply cable has been connected.*

*Note* Corner grounding is not allowed for supply voltages above 3 x 480 V, 60 Hz.

Check that the supply voltage and frequency correspond to the values stated on the nameplate.

The wires in the motor terminal box must be as short as possible. Excepted from this is the separated earth conductor which must be so long that it is the last one to be disconnected in case the cable is inadvertently pulled out of the cable entry.

For maximum backup fuse, see section 27.1 Supply voltage.

---

9.3 Additional protection

9.3.1 Single-phase motors

If the motor is connected to an electric installation where an earth leakage circuit breaker (ELCB) or ground fault circuit interrupter (GFCI) is used as additional protection, this circuit breaker or interrupter must be marked with the following symbol:

*Note* When an earth leakage circuit breaker or ground fault circuit interrupter is selected, the total leakage current of all the electrical equipment in the installation must be taken into account.

The leakage current of the motor can be found in section 26.2 Leakage current.

9.3.2 Three-phase motors

If the motor is connected to an electric installation where an earth leakage circuit breaker (ELCB) or ground fault circuit interrupter (GFCI) is used as additional protection, this circuit breaker or interrupter must be of the following type:

- It must be suitable for handling leakage currents and cutting-in with short pulse-shaped leakage.
- It must trip out when alternating fault currents and fault currents with DC content, i.e. pulsating DC and smooth DC fault currents, occur.

For these motors an earth leakage circuit breaker or ground fault circuit interrupter, type B, must be used.

This circuit breaker or interrupter must be marked with the following symbols:

*Note* When you select an earth leakage circuit breaker or ground fault circuit interrupter, take into account the total leakage current of all the electrical equipment in the installation.

You find the leakage current of the motor in section 27.2 Leakage current.

Protection against phase unbalance

The motor must be connected to a power supply with a quality corresponding to IEC 60146-1-1, class C, to ensure correct motor operation at phase unbalance.

This also ensures long life of the components.
9.4 Connection terminals
The descriptions and terminal overviews in this section apply to both single-phase and three-phase motors.
For maximum tightening torques, see section Torques, page 49.
The number of terminals depends on the functional module (FM).
You can identify the fitted module on the motor nameplate.
See fig. 20.

9.4.1 Connection terminals, advanced functional module (FM 300)
The advanced functional module is only available as an option.
The advanced module has these connections:
• three analog inputs
• one analog output
• two dedicated digital inputs
• two configurable digital inputs or open-collector outputs
• Grundfos Digital Sensor input and output
• two Pt100/1000 inputs
• two LiqTec sensor inputs
• two signal relay outputs
• GENIbus connection.
See fig. 21.

Digital input 1 is factory-set to be start/stop input where open circuit will result in stop.

A jumper has been factory-fitted between terminals 2 and 6. Remove the jumper if digital input 1 is to be used as external start/stop or any other external function.

As a precaution, the wires to be connected to the connection groups below must be separated from each other by reinforced insulation in their entire lengths.

• Inputs and outputs
All inputs and outputs are internally separated from the power supply-conducting parts by reinforced insulation and galvanically separated from other circuits.
All control terminals are supplied by safety extra-low voltage (SELV), thus ensuring protection against electric shock.

• Signal relay outputs
  – Signal relay 1:
    LIVE:
    Power supply voltages up to 250 VAC can be connected to this output.
    SELV:
    The output is galvanically separated from other circuits.
    Therefore, the supply voltage or safety extra-low voltage can be connected to the output as desired.
  – Signal relay 2:
    SELV:
    The output is galvanically separated from other circuits.
    Therefore, the supply voltage or safety extra-low voltage can be connected to the output as desired.

• Power supply (terminals N, PE, L or L1, L2, L3, PE).
A galvanically safe separation must fulfil the requirements for reinforced insulation including creepage distances and clearances specified in EN 61800-5-1.
If you use an external supply source, there must be a connection to GND.

Fig. 21 Connection terminals, FM 300 (option)
9.4.2 Connection terminals, standard functional module (FM 200)

The standard module has these connections:
- two analog inputs
- two digital inputs or one digital input and one open-collector output
- Grundfos Digital Sensor input and output
- two signal relay outputs
- GENIbus connection.

See fig. 22.

**Digital input 1 is factory-set to be start/stop input where open circuit will result in stop.**

**Note**
A jumper has been factory-fitted between terminals 2 and 6. Remove the jumper if digital input 1 is to be used as external start/stop or any other external function.

**Note**
As a precaution, the wires to be connected to the connection groups below must be separated from each other by reinforced insulation in their entire lengths.

**Inputs and outputs**
All inputs and outputs are internally separated from the power supply-conducting parts by reinforced insulation and galvanically separated from other circuits.
All control terminals are supplied by safety extra-low voltage (SELV), thus ensuring protection against electric shock.

**Signal relay outputs**
- Signal relay 1:
  - **LIVE:**
    Power supply voltages up to 250 VAC can be connected to this output.
  - **SELV:**
    The output is galvanically separated from other circuits.
    Therefore, the supply voltage or safety extra-low voltage can be connected to the output as desired.
- Signal relay 2:
  - **SELV:**
    The output is galvanically separated from other circuits.
    Therefore, the supply voltage or safety extra-low voltage can be connected to the output as desired.

**Power supply** (terminals N, PE, L or L1, L2, L3, PE).
A galvanically safe separation must fulfill the requirements for reinforced insulation including creepage distances and clearances specified in EN 61800-5-1.
If an external supply source is used, there must be a connection to GND.

</table>
9.5 Signal cables

- Use screened cables with a cross-sectional area of min. 20 AWG and max. 16 AWG (0.5 mm² and max. 1.5 mm²) for external on/off switch, digital inputs, setpoint and sensor signals.
- Connect the screens of the cables to frame at both ends with good connection. The screens must be as close as possible to the terminals. See fig. 23.

9.6 Bus connection cable

9.6.1 New installations

For the bus connection, use a screened 3-core cable with a cross-sectional area of min. 20 AWG and max. 16 AWG (0.5 mm² and max. 1.5 mm²).

- If the motor is connected to a unit with a cable clamp which is identical to the one on the motor, connect the screen to this cable clamp.
- If the unit has no cable clamp as shown in fig. 24, leave the screen unconnected at this end.

9.6.2 Replacing an existing motor

- If a screened 2-core cable is used in the existing installation, connect the cable as shown in fig. 25.

10. Startup

10.1 Flushing the pipe system

The pump is not designed to pump liquids containing solid particles such as pipe debris and welding slag. Before starting up the pump, clean the pipe system thoroughly, and flush and fill it with clean water.

- Caution: The warranty does not cover any damage caused by flushing the pipe system by means of the pump.

10.2 Priming

Do not start the pump until it has been filled with liquid and vented. To ensure correct venting, the vent screw should point upwards.

- Caution: The warranty does not cover any damage caused by flushing the pipe system by means of the pump.

Closed systems or open systems where the liquid level is above the pump inlet

1. Close the discharge isolating valve and loosen the air vent screw in the motor stool. See fig. 26.

- Warning: Pay attention to the direction of the vent hole, and make sure that the escaping hot or cold liquid does not cause injury to persons or damage to the equipment.

2. Slowly open the isolating valve in the suction pipe until a steady stream of liquid runs out of the vent hole.
3. Tighten the air vent screw and completely open the isolating valve(s).
Open systems where the liquid level is below the pump inlet
The suction pipe and the pump must be filled with liquid and vented before you start the pump.
1. Close the discharge isolating valve and open the isolating valve in the suction pipe.
2. Loosen the air vent screw. See fig. 26.
3. Remove the plug from one of the pump flanges, depending on the pump location.
4. Pour liquid through the priming port until the suction pipe and the pump are filled with liquid.
5. Replace the plug and tighten securely.
6. Tighten the air vent screw.
The suction pipe can to some extent be filled with liquid and vented before it is connected to the pump. You can also install a priming device before the pump.

10.3 Starting
1. Before starting the pump, completely open the isolating valve on the suction side of the pump and leave the discharge isolating valve almost closed.
2. Start the pump. See section 11. User interfaces.
3. Vent the pump during starting by loosening the air vent screw in the motor stool until a steady stream of liquid runs out of the vent hole. See fig. 26.

**Warning**
Pay attention to the direction of the vent hole, and make sure that the escaping hot or cold liquid does not cause injury to persons or damage to the equipment.
4. When the pipe system has been filled with liquid, slowly open the discharge isolating valve until it is completely open.

10.4 Shaft seal run-in
The seal faces are lubricated by the pumped liquid, meaning that there may be a certain amount of leakage from the shaft seal. When the pump is started up for the first time, or when a new shaft seal is installed, a certain run-in period is required before the leakage is reduced to an acceptable level. The time required for this depends on the operating conditions, i.e. every time the operating conditions change, a new run-in period will be started. Under normal conditions, the leaking liquid will evaporate. As a result, no leakage will be detected. However, liquids such as kerosene will not evaporate. The leakage may therefore be seen as a shaft seal failure.

11. User interfaces

**Warning**
The product may be so hot that only the buttons must be touched to avoid burns.

Pump settings can be made by means of the following user interfaces:

**Control panels**
- Advanced control panel. See section 13. Advanced control panel.

**Remote controls**

If you switch-off the power supply to the pump, the settings will be stored.

**Factory settings**
TPE2 (D) pumps have been factory-set to constant-curve control mode. See section 12.1.2 Pump in constant-curve control mode. The setpoint value corresponds to 100 %, of maximum pump performance. See data booklet or WebCAPS.
TPE3 (D) pumps have been factory-set to AUTOADAPT control mode. See section 15.4.1 AUTOADAPT.
12. Standard control panel

This control panel is fitted as standard on TPE2 (D) pumps.

12.1 Setpoint setting

Set the desired setpoint of the pump by pressing ↑ or ↓. The light fields on the control panel will indicate the setpoint set.

12.1.1 Pump in differential-pressure control mode

The following example applies to a pump in an application where a pressure sensor gives a feedback to the pump. If you retrofit the sensor to the pump, you must set it up manually as the pump does not automatically register a connected sensor.

Figure 28 shows that the light fields 5 and 6 are activated, indicating a desired setpoint of 4.3 psi (3 m) with a sensor measuring range from 0 to 8.5 psi (0 to 6 m). The setting range is equal to the sensor measuring range.

12.1.2 Pump in constant-curve control mode

In constant-curve control mode, the pump performance will lie between the maximum and minimum curve of the pump. See fig. 29.

**Fig. 27** Standard control panel

**Fig. 28** Setpoint set to 4.3 psi (3 m), differential-pressure control

**Fig. 29** Pump in constant-curve control mode
Setting to maximum curve:
- Press \( \) continuously to change over to the maximum curve of the pump (top light field flashes). When the top light field is on, press \( \) for 3 seconds until the light field starts flashing.
- To change back, press \( \) continuously until the desired setpoint is indicated.

**Example:** Pump set to maximum curve.

Figure 30 shows that the top light field is flashing, indicating maximum curve.

![Fig. 30 Maximum curve duty](image)

Setting to minimum curve:
- Press \( \) continuously to change over to the minimum curve of the pump (bottom light field flashes). When the bottom light field is on, press \( \) for 3 seconds until the light field starts flashing.
- To change back, press \( \) continuously until the desired setpoint is indicated.

**Example:** Pump set to minimum curve.

Figure 31 shows that the bottom light field is flashing, indicating minimum curve.

![Fig. 31 Minimum curve duty](image)

### 12.1.3 Start/stop of pump

Start the pump by pressing \( \) or by continuously pressing \( \) until the desired setpoint is indicated.

Stop the pump by pressing \( \). When the pump is stopped, the "Stop" text next to the button will illuminate. You can also stop the pump by continuously pressing \( \) until none of the light fields are on.

If you have stopped the pump by pressing \( \), it can only be given free to operation by pressing \( \) again.

If you have stopped the pump by pressing \( \), it can only be restarted by pressing \( \).

You can also stop the pump with the Grundfos GO Remote or via a digital input set to "External stop". See section 20. **Priority of settings**.

### 12.1.4 Resetting of fault indications

You can reset a fault indication in one of the following ways:
- Via the digital input if it has been set to "Alarm resetting".
- Briefly press \( \) or \( \) on the pump. This will not change the setting of the pump.
- You cannot reset a fault indication by pressing \( \) or \( \) if the buttons have been locked.
- Switch off the power supply until the indicator lights are off.
- Switch the external start/stop input off and then on again.
- With the Grundfos GO Remote.
13. Advanced control panel

This control panel is fitted as standard on TPE3 (D) pumps. TPE2 (D) pumps can be fitted with the advanced control panel as an option.

Fig. 32 Advanced control panel

13.1 Menu structure

The pump incorporates a startup guide which is started at the first startup. After the startup guide, the four main menus will appear in the display.

1. Home

This menu shows up to four user-defined parameters with shortcuts or a graphical illustration of a Q/H performance curve.

2. Status

This menu shows the status of the pump and system as well as warnings and alarms.

Note You cannot make any settings in this menu.

3. Settings

This menu gives access to all setting parameters. A detailed setting of the pump can be made in this menu. See section 15. Description of selected functions.

4. Assist

This menu enables assisted pump setup, provides a short description of the control modes and offers fault advice. See section 16. Assist.

14. Grundfos GO Remote

The pump is designed for wireless radio or infrared communication with the Grundfos GO Remote. The Grundfos GO Remote enables setting of functions and gives access to status overviews, technical product information and actual operating parameters. The Grundfos GO Remote offers the following mobile interfaces (MI). See fig. 33.

14.1 Communication

When the Grundfos GO Remote communicates with the pump, the indicator light in the middle of the Grundfos Eye will flash green. See section 21. Grundfos Eye.

Communication must be established using one of these communication types:

- radio communication
- infrared communication.

14.1.1 Radio communication

Radio communication can take place at distances up to 30 meters. It is necessary to enable communication by pressing or on the pump control panel.

14.1.2 Infrared communication

When communicating via infrared light, the Grundfos GO Remote must be pointed at the pump control panel.

15. Description of selected functions

15.1 Setpoint
The setpoint for all control modes, except AUTO\textsubscript{ADAPT} and FLOW\textsubscript{ADAPT}, can be set in this submenu when the desired control mode has been selected. See section 15.4 Control mode.

15.2 Operating mode
Possible operating modes:
- **Normal**
  The pump runs according to the selected control mode.
- **Stop**
  The pump stops.
- **Min.**
  The minimum curve mode can be used in periods in which a minimum flow is required. This operating mode is for instance suitable for manual night setback if "Automatic Night Setback" is not desired.
- **Max.**
  The maximum curve mode can be used in periods in which a maximum flow is required. This operating mode is for instance suitable for systems with hot-water priority.
- **Manual**
  The pump is operating at a manually set speed. See section 15.3 Set manual speed.

The pump can be set to operate according to the maximum or minimum curve, like an uncontrolled pump. See fig. 34.

![Fig. 34 Maximum and minimum curves](image)

15.3 Set manual speed
The pump speed can be set in \%. When the operating mode has been set to "Manual", the pump will run at the set speed.

15.4 Control mode
Possible control modes:
- **AUTO\textsubscript{ADAPT}**
- **FLOW\textsubscript{ADAPT}**
- **Prop. press.** (proportional pressure)
- **Const. pressure** (constant pressure)
- **Const. temp.** (constant temperature)
- **Con. diff. press.** (constant differential pressure)
- **Con. diff. temp.** (constant differential temperature)
- **Const. flow rate** (constant flow rate)
- **Const. level** (constant level)
- **Const. other val.** (constant other value)
- **Const. curve** (constant curve).

![Diagram](image)

Note: The operating mode must be set to "Normal" before a control mode can be enabled.

You can change the setpoint for all control modes, except AUTO\textsubscript{ADAPT} and FLOW\textsubscript{ADAPT}, in the "Setpoint" submenu under "Settings" when you have selected the desired control mode.

15.4.1 AUTO\textsubscript{ADAPT}

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>AUTO\textsubscript{ADAPT}</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>-</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>-</td>
</tr>
</tbody>
</table>

The AUTO\textsubscript{ADAPT} control mode continuously adapts the pump performance according to the actual system characteristic.

**Note** You cannot set the setpoint manually.

![Fig. 35 AUTO\textsubscript{ADAPT}](image)

When you have enabled the AUTO\textsubscript{ADAPT} control mode, the pump will start with the factory setting, $H_{\text{fac}} = H_{\text{set1}}$, and then adjust its performance to $A_1$. See fig. 35.

When the pump registers a lower head on the max. curve, $A_2$, the AUTO\textsubscript{ADAPT} function will automatically select a correspondingly lower control curve, $H_{\text{set2}}$. If the valves in the system close, the pump will adjust its performance to $A_3$.

$A_1$: Original duty point.
$A_2$: Lower registered head on the max. curve.
$A_3$: New duty point after AUTO\textsubscript{ADAPT} control.
$H_{\text{set1}}$: Original setpoint setting.
$H_{\text{set2}}$: New setpoint after AUTO\textsubscript{ADAPT} control.
$H_{\text{fac}}$: Factory setting.
$H_{\text{auto min}}$: A fixed value of 5 ft (1.5 m).

The AUTO\textsubscript{ADAPT} control mode is a form of proportional-pressure control where the control curves have a fixed origin, $H_{\text{auto min}}$.

The AUTO\textsubscript{ADAPT} control mode has been developed specifically for heating systems and Grundfos do not recommend it for air-conditioning and cooling systems.
15.4.2 FLOW\textsubscript{ADAPT}

When you select FLOW\textsubscript{ADAPT}, the pump will run AUTO\textsubscript{ADAPT} and ensure that the flow never exceeds the entered FLOW\textsubscript{LIMIT} value.

The setting range for FLOW\textsubscript{LIMIT} is 25 to 90 %, of the Q\textsubscript{max} of the pump.

The factory setting of the FLOW\textsubscript{LIMIT} is the flow where the AUTO\textsubscript{ADAPT} factory setting meets the maximum curve. See fig. 36.

\textbf{Note} \textit{Do not set the FLOW\textsubscript{LIMIT} lower than the dimensioned duty point.}

![Fig. 36 FLOW\textsubscript{ADAPT}](image)

15.4.3 Proportional pressure

The pump head is reduced at decreasing water demand and increased at rising water demand. See fig. 37.

This control mode is especially suitable in systems with relatively large pressure losses in the distribution pipes. The head of the pump will increase proportionally to the flow in the system to compensate for the large pressure losses in the distribution pipes.

The setpoint can be set with an accuracy of 0.33 ft (0.1 m). The head against a closed valve is half the setpoint, H\textsubscript{set}.

![Fig. 37 Proportional pressure](image)

15.4.4 Constant pressure

The pump maintains a constant discharge pressure, independently of the flow rate. See fig. 39.

![Fig. 39 Constant pressure](image)

This control mode requires an external pressure sensor as shown in the examples below.

\textbf{Examples}

- One external pressure sensor.

![Fig. 40 Constant pressure](image)
15.4.5 Constant temperature

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>Constant temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>·</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>·</td>
</tr>
</tbody>
</table>

This control mode ensures a constant temperature. Constant temperature is a comfort control mode that can be used in domestic hot-water systems to control the flow to maintain a fixed temperature in the system. See fig. 41. When this control mode is used, no balancing valves must be installed in the system.

Fig. 41 Constant temperature

This control mode requires either an internal or external temperature sensor as shown in the examples below:

**Examples**
- Factory-fitted temperature sensor (only TPE3 (D)).
- One external temperature sensor.

Fig. 42 Constant temperature

15.4.6 Constant differential pressure

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>Constant differential pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>·</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>·</td>
</tr>
</tbody>
</table>

The pump maintains a constant differential pressure, independently of the flow in the system. See fig. 43. This control mode is primarily suitable for systems with relatively small pressure losses.

Fig. 43 Constant differential pressure

This control mode requires either an internal or external differential-pressure sensor or two external pressure sensors as shown in the examples below:

**Examples**
- Factory-fitted differential-pressure sensor (only TPE3 (D)).
- One external differential-pressure sensor.
- Two external pressure sensors.

Fig. 44 Constant differential pressure
15.4.7 Constant differential temperature

The pump maintains a constant differential temperature in the system and the pump performance is controlled according to this. See fig. 45.

**Fig. 45** Constant differential temperature

This control mode requires either two temperature sensors or one external differential-temperature sensor as shown in the examples below:

**Examples**

- Factory-fitted temperature sensor and an external temperature sensor (only TPE3 (D)).

- Two external temperature sensors.

- One external differential-temperature sensor.

**Fig. 46** Constant differential temperature

15.4.8 Constant flow rate

The pump maintains a constant flow in the system, independently of the head. See fig. 47.

**Fig. 47** Constant flow rate

This control mode requires an external flow sensor as shown below:

**Example**

- One external flow sensor.

**Fig. 48** Constant flow rate
15.4.9 Constant level

The pump maintains a constant level, independently of the flow rate. See fig. 49.

This control mode requires an external level sensor.
The pump can control the level in a tank in two ways:
• as an emptying function where the pump draws the liquid from the tank.
• as a filling function where the pump pumps the liquid into the tank.

The type of level control function depends on the setting of the built-in controller. See section 15.13 Controller settings.

Examples
• One external level sensor.
  – emptying function.
• One external level sensor.
  – filling function.

15.4.10 Constant other value

Any other value is kept constant.

15.4.11 Constant curve

You can set the pump to operate according to a constant curve, like an uncontrolled pump. See fig. 51.
You can set the desired speed in % of maximum speed in the range from 25 to 100 %.

Note
Depending on the system characteristic and the duty point, the 100 % setting may be slightly smaller than the pump's actual maximum curve even though the display shows 100 %. This is due to power and pressure limitations built into the pump. The deviation varies according to pump type and pressure loss in the pipes.
15.5 \textit{FLOW}_{\text{LIMIT}}

\begin{tabular}{|l|l|}
\hline
Pump variant & FLOW_{\text{LIMIT}} \\
\hline
TPE3 (D) & ● \\
TPE2 (D) & - \\
\hline
\end{tabular}

FLOW_{\text{LIMIT}}
- Enable FLOW_{\text{LIMIT}} function.
- Set FLOW_{\text{LIMIT}}.

\begin{align*}
H \quad 25\% \quad 90\% \quad Q_{\text{max}}
\end{align*}

\textbf{Fig. 53 FLOW_{\text{LIMIT}}}

The FLOW_{\text{LIMIT}} function can be combined with the following control modes:
- Prop. press.
- Con. diff. press.
- Con. diff. temp.
- Const. temp.
- Const. curve.

A flow-limiting function ensures that the flow never exceeds the entered FLOW_{\text{LIMIT}} value.

The setting range for FLOW_{\text{LIMIT}} is 25 to 90 \% of the \(Q_{\text{max}}\) of the pump.

The factory setting of the FLOW_{\text{LIMIT}} is the flow where the AUTO\textit{ADAPT} factory setting meets the maximum curve. See fig. 36.

15.6 Automatic Night Setback

\begin{tabular}{|l|l|}
\hline
Pump variant & Automatic Night Setback \\
\hline
TPE3 (D) & ● \\
TPE2 (D) & - \\
\hline
\end{tabular}

Once you have enabled Automatic Night Setback, the pump automatically changes between normal duty and night setback (duty at low performance).

Changeover between normal duty and night setback depends on the flow-pipe temperature.

The pump automatically changes over to night setback when the built-in sensor registers a flow-pipe temperature drop of more than 18 to 27 °F (10 to 15 °C) within approx. two hours.

The temperature drop must be at least 1.8 °F/min (0.1 °C/min). Changeover to normal duty takes place without a time lag when the temperature has increased by approx. 18 °F (10 °C).

\begin{table}[ht]
\centering
\begin{tabular}{|l|l|l|}
\hline
Parameter & Possible units \\
\hline
Pressure & ft, psi, bar, m, kPa \\
Pump flow & gpm, m\textsuperscript{3}/h, l/s, yd\textsuperscript{3}/h \\
Liquid temperature & °F, °C \\
Other parameter & % \\
\hline
\end{tabular}
\end{table}

15.7 Analog inputs

Available inputs depending on the functional module fitted in the pump:

\begin{table}[ht]
\centering
\begin{tabular}{|l|l|l|}
\hline
Function (terminal) & FM 200 (standard) & FM 300 (advanced) \\
\hline
Analog input 1, setup (4) & ● & ● \\
Analog input 2, setup (7) & ● & ● \\
Analog input 3, setup (14) & - & ● \\
\hline
\end{tabular}
\end{table}

To set up an analog input, make the settings below.

Function
The analog inputs can be set to these functions:
- Not active
- Feedback sensor
- Ext. setpoint influence
  See section 15.15 \textit{Setpoint influence}
- Other function.

Measured parameter
Select one of the parameters, i.e. the parameter to be measured in the system by the sensor connected to the actual analog input.

Unit
Available measuring units:

15.8 Pt100/1000 inputs

Available inputs depending on the functional module fitted in the pump:

\begin{table}[ht]
\centering
\begin{tabular}{|l|l|l|}
\hline
Function (terminal) & FM 200 (standard) & FM 300 (advanced) \\
\hline
Pt100/1000 input 1, setup (17 and 18) & - & ● \\
Pt100/1000 input 2, setup (18 and 19) & - & ● \\
\hline
\end{tabular}
\end{table}

Function
The Pt100/1000 inputs can be set to these functions:
- Not active
- Feedback sensor
- Ext. setpoint influence
  See section 15.15 \textit{Setpoint influence}
- Other function.

Measured parameter
Select one of the parameters, i.e. the parameter to be measured in the system.

Note
You cannot enable Automatic Night Setback when the pump is in constant-curve mode.
15.9 Digital inputs
Available inputs depending on the functional module fitted in the pump:

<table>
<thead>
<tr>
<th>Function (terminal)</th>
<th>FM 200 (standard)</th>
<th>FM 300 (advanced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital input 1, setup (2 and 6)</td>
<td>●</td>
<td>●</td>
</tr>
<tr>
<td>Digital input 2, setup (1 and 9)</td>
<td>●</td>
<td>●</td>
</tr>
</tbody>
</table>

To set up a digital input, make the settings below.

Function
Select one of these functions:
- Not active
  When set to "Not active", the input has no function.
- External stop
  When the input is deactivated (open circuit), the pump will stop.
- Min. (minimum speed)
  When the input is activated, the pump will run at the set min. speed.
- Max. (maximum speed)
  When the input is activated, the pump will run at the set max. speed.
- External fault
  When the input is activated, a timer will be started. If the input is activated for more than 5 seconds, the pump will be stopped and a fault will be indicated.
- Alarm resetting
  When the input is activated, a possible fault indication will be reset.
- Dry running
  When this function has been selected, lack of inlet pressure or water shortage can be detected. When lack of inlet pressure or water shortage (dry running) is detected, the pump will be stopped. The pump cannot restart as long as the input is activated.

This requires the use of an accessory, such as these:
- a pressure switch installed on the suction side of the pump
- a float switch installed on the suction side of the pump.
- Accumulated flow
  When this function has been selected, the accumulated flow can be registered. This requires the use of a flowmeter which can give a feedback signal as a pulse per defined flow of water.
  See section 15.17.1 Pulse flow meter setup.
- Predefined setpoint digit 1 (applies only to digital input 2)
  When digital inputs are set to predefined setpoint, the pump will operate according to a setpoint based on the combination of the activated digital inputs.
  See section 15.15.2 Predefined setpoints.

The priority of the selected functions in relation to each other appears from section 20. Priority of settings.

A stop command will always have the highest priority.

15.10 Digital inputs/outputs
Available inputs/outputs depending on the functional module fitted in the pump:

<table>
<thead>
<tr>
<th>Function (terminal)</th>
<th>FM 200 (standard)</th>
<th>FM 300 (advanced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital input/output 3, setup (10 and 16)</td>
<td>●</td>
<td>●</td>
</tr>
<tr>
<td>Digital input/output 4, setup (11 and 18)</td>
<td>●</td>
<td>●</td>
</tr>
</tbody>
</table>

To set up a digital input/output, make the settings below.

Mode
You can set the digital input/output 3 and 4 to act as digital input or digital output:
- Digital input
- Digital output.

Function
You can set the digital input/output 3 and 4 to these functions:

This requires the use of an accessory, such as these:

- only TPE2 (D).

Possible functions, digital input/output 3

<table>
<thead>
<tr>
<th>Function if input</th>
<th>Function if output</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Not active</td>
<td>● Not active</td>
</tr>
<tr>
<td>● External stop</td>
<td>● Ready</td>
</tr>
<tr>
<td>● Min.</td>
<td>● Alarm</td>
</tr>
<tr>
<td>● Max.</td>
<td>● Operation</td>
</tr>
<tr>
<td>● External fault</td>
<td>● Pump running</td>
</tr>
<tr>
<td>● Alarm resetting</td>
<td>● Warning</td>
</tr>
<tr>
<td>● Dry running</td>
<td>● Limit 1 exceeded*</td>
</tr>
<tr>
<td>● Accumulated flow*</td>
<td>● Limit 2 exceeded*</td>
</tr>
<tr>
<td>● Predefined setpoint digit 2</td>
<td></td>
</tr>
</tbody>
</table>

Possible functions, digital input/output 4

<table>
<thead>
<tr>
<th>Function if input</th>
<th>Function if output</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Not active</td>
<td>● Not active</td>
</tr>
<tr>
<td>● External stop</td>
<td>● Ready</td>
</tr>
<tr>
<td>● Min.</td>
<td>● Alarm</td>
</tr>
<tr>
<td>● Max.</td>
<td>● Operation</td>
</tr>
<tr>

</tr>
<tr>
<td>● Accumulated flow*</td>
<td>● Limit 2 exceeded*</td>
</tr>
<tr>
<td>● Predefined setpoint digit 3</td>
<td></td>
</tr>
</tbody>
</table>

* Only TPE2 (D).
15.11 Relay outputs

<table>
<thead>
<tr>
<th>Function (terminal)</th>
<th>FM 200 (standard)</th>
<th>FM 300 (advanced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relay output 1 (NC, C1, NO)</td>
<td>●</td>
<td>●</td>
</tr>
<tr>
<td>Relay output 2 (NC, C2, NO)</td>
<td>●</td>
<td>●</td>
</tr>
</tbody>
</table>

The pump incorporates two signal relays for potential-free signalling. See section 22. Signal relays for further information.

You can configure the signal relays to be activated by one of the following incidents:
- Ready
- Operation
- Alarm
- Warning
- Limit 2 exceeded*
- Limit 1 exceeded*
- Pump running
- Relubricate
- Control of external fan
- Not active.
* Only TPE2 (D).

15.12 Analog output

Whether the analog output is available or not, depends on the functional module fitted in the pump:

<table>
<thead>
<tr>
<th>Function (terminal)</th>
<th>FM 200 (standard)</th>
<th>FM 300 (advanced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analog output</td>
<td>-</td>
<td>●</td>
</tr>
</tbody>
</table>

To set up the analog output, make the settings below.

Output signal
- 0-10 V
- 0-20 mA
- 4-20 mA.

Function of analog output
- Actual speed
- Actual value
- Resulting setpoint
- Motor load
- Motor current
- Limit 1 exceeded*
- Limit 2 exceeded*
- Flow rate
* Only TPE2 (D).

15.13 Controller settings

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>Controller settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>●</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>●</td>
</tr>
</tbody>
</table>

The pumps have a factory default setting of gain ($K_p$) and integral time ($T_i$).

However, if the factory setting is not the optimum setting, you can change the gain and the integral time:
- Set the gain ($K_p$) within the range from 0.1 to 20.
- Set the integral-action time ($T_i$) within the range from 0.1 to 3600 s.
  If you have selected 3600 s, the controller will function as a $P$ controller.

Furthermore, you can set the controller to inverse control. This means that if the setpoint is increased, the speed will be reduced. In the case of inverse control, set the gain ($K_p$) within the range from -0.1 to -20.

Guidelines for setting of PI controller

The tables below show the recommended controller settings:

<table>
<thead>
<tr>
<th>Differential-pressure control</th>
<th>$K_p$</th>
<th>$T_i$</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.5</td>
<td>0.5</td>
</tr>
<tr>
<td></td>
<td>0.5</td>
<td>0.5</td>
</tr>
</tbody>
</table>

$L_1 =$ Distance ft (m) between pump and sensor.
1) In heating systems, an increase in pump performance will result in a rise in temperature at the sensor.

2) In cooling systems, an increase in pump performance will result in a drop in temperature at the sensor.

$L_2 =$ Distance ft (m) between heat exchanger and sensor.

### General rules of thumb
- If the controller is too slow-reacting, increase $K_p$.
- If the controller is hunting or unstable, dampen the system by reducing $K_p$ or increasing $T_i$.

### 15.14 Operating range

#### Pump variant

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>Operating range</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>●</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>●</td>
</tr>
</tbody>
</table>

Set the operating range as follows:
- Set the minimum speed within the range from fixed minimum speed to user-set maximum speed.
- Set the maximum speed within the range from user-set minimum speed to fixed maximum speed.

The range between the user-set minimum and maximum speeds is the operating range. See fig. 54.

#### Note

**Speeds below 25% may result in noise from the shaft seal.**

---

15.15 Setpoint influence
15.15.1 External setpoint influence

You can influence the setpoint by an external signal, either via one of the analog inputs or, if you fit an advanced functional module, via one of the Pt100/1000 inputs.

Before you can enable the "Digital inputs", set one of the analog inputs or Pt100/1000 inputs to "External setpoint function". See sections 15.7 Analog inputs and 15.8 Pt100/1000 inputs.

If more than one input has been set up for setpoint influence, the function will select the analog input with the lowest number, for example "Analog input 2", and ignore the other inputs, for example "Analog input 3" or "Pt100/1000 input 1".

Example
See fig. 55.

At a lower sensor value of 0 psi, a set setpoint of 29 psi and an external setpoint of 60 %, the actual setpoint is 0.60 x (29 - 0) + 0 = 17.4 psi.

Actual setpoint = actual input signal x (setpoint - lower value) + lower value.

![Setpoint influence diagram](image)

Fig. 55 Example of setpoint influence

The table below gives an overview of the types of setpoint influence and the availability depending on pump type.

<table>
<thead>

</tbody>
</table>

You can select these functions:
- Not active
  When set to "Not active", the setpoint will not be influenced from any external function.
- Linear function
  The setpoint is influenced linearly from 0 to 100 %. See fig. 56.

![Linear function diagram](image)

Fig. 56 Linear function

- "Linear with Stop" and "Linear with Min."
  - Linear with Stop
    In the input signal range from 20 to 100 %, the setpoint is influenced linearly.
    If the input signal is below 10 %, the pump will change to operating mode "Stop".
    If the input signal is increased above 15 %, the operating mode will be changed back to "Normal".
    See fig. 57.
  - Linear with Min.
    In the input signal range from 20 to 100 %, the setpoint is influenced linearly.
    If the input signal is below 10 %, the pump will change to operating mode "Min.".
    If the input signal is increased above 15 %, the operating mode will be changed back to "Normal".
    See fig. 57.
• Inverse function
The setpoint is influenced inversely from 0 to 100 %.
See fig. 58.

Setpoint influence [%]

Fig. 58 Inverse function

• "Inverse with Stop" and "Inverse with Min."
  – Inverse with Stop
    In the input signal range from 0 to 80 %, the setpoint is influenced inversely.
    If the input signal is above 90 %, the pump will change to operating mode "Stop".
    If the input signal is reduced below 85 %, the operating mode will be changed back to "Normal".
    See fig. 59.
  – Inverse with Min.
    In the input signal range from 0 to 80 %, the setpoint is influenced inversely.
    If the input signal is above 90 %, the pump will change to operating mode "Min.".
    If the input signal is reduced below 85 %, the operating mode will be changed back to "Normal".
    See fig. 59.

Setpoint influence [%]

Fig. 59 "Inverse with Stop" and "Inverse with Min."

• Influence table
The setpoint is influenced by a curve made out of two to eight points. There will be a straight line between the points and a horizontal line before the first point and after the last point.

Setpoint influence [%]

Fig. 60 Influence table

• Influence table with Stop at Min.
The setpoint is influenced by a curve made out of two to eight points. There will be a straight line between the points and a horizontal line before the first point and after the last point.
If the input signal is below 10 %, the pump will change to operating mode "Stop".
If the input signal is increased above 15 %, the operating mode will be changed back to "Normal".
See fig. 61.

Setpoint influence [%]

Fig. 61 Influence table with Stop at Min.
• Influence table with Stop at Max.
The setpoint is influenced by a curve made out of two to eight points. There will be a straight line between the points and a horizontal line before the first point and after the last point. If the input signal is above 90 %, the pump will change to operating mode “Min.”. If the input signal is reduced below 85 %, the operating mode will be changed back to “Normal”. See fig. 62.

15.15.3 Temperature influence

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>Temperature influence</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>●</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>-</td>
</tr>
</tbody>
</table>

When you enable this function in proportional- or constant-pressure control mode, the setpoint for head will be reduced according to the liquid temperature. Temperature influence can be set to function at liquid temperatures below +176 °F or +122 °F (80 °C or 50 °C). These temperature limits are called T_max. The setpoint is reduced in relation to the head set (= 100 %) according to the characteristics below.

![Temperature Influence](image)

Fig. 63 Select the measured parameter of Pt100/1000 input 2

In the above example, T_max. = +176 °F (+80 °C) has been selected.
The actual liquid temperature T_actual causes the setpoint for head to be reduced from 100 % to H_actual.
The temperature influence function requires the following:
• Proportional-pressure, constant-pressure or constant-curve control mode.
• Pump installed in flow pipe.
• System with flow-pipe temperature control.
Temperature influence is suitable for the following systems:
• Systems with variable flows (for example two-pipe heating systems) in which the enabling of the temperature influence function will ensure a further reduction of the pump performance in periods with small heating demands and consequently a reduced flow-pipe temperature.
• Systems with almost constant flows (for example one-pipe heating systems and underfloor heating systems), in which variable heating demands cannot be registered as changes in the head as is the case with two-pipe heating systems. In such systems, you can only adjust the pump performance by enabling the temperature influence function.

Selection of T_max.

In systems with a dimensioned flow-pipe temperature of:
• up to and including +131 °F (+55 °C), select T_max. = +122 °F (+50 °C)
• above +131 °F (+55 °C), select T_max. = +176 °F (80 °C).

**Note** You cannot use the temperature influence function in air-conditioning and cooling systems.
15.16 Monitoring functions

15.16.1 Limit-exceeded function

This function can monitor set limits of analog values. It will react if the values exceed the limits. Each limit can be set as a maximum or minimum value. For each of the monitored values, you must define a warning limit and an alarm limit.

The function makes it possible to monitor two different locations in a pump system at the same time. For instance the pressure at a consumer and the pump discharge pressure. This ensures that the discharge pressure does not reach a critical value.

If the value exceeds the warning limit, a warning is given. If the value exceeds the alarm limit, the pumps will be stopped.

You can set a delay between the detection of an exceeded limit and the activation of a warning or an alarm. You can also set a delay for resetting a warning or an alarm.

You can reset a warning automatically or manually. Furthermore, you can set whether the system is to restart automatically after an alarm, or if the alarm must be reset manually. Restarting can be delayed by an adjustable time.

You can also set a startup delay ensuring that the system reaches a steady state before the function becomes active.

15.17 Special functions

15.17.1 Pulse flow meter setup

You can connect an external pulse flowmeter to one of the digital inputs in order to register the actual and accumulated flows. Based on this, you can also calculate the specific energy btu/lb (kWh/m³).

To enable a pulse flowmeter, set one of the digital-input functions to “Accumulated flow” and set the pumped volume per pulse. See section 15.9 Digital inputs.

15.17.2 Ramps

The setting of ramps is only relevant in the case of constant-curve operation.

The ramps determine how quickly the motor can accelerate and decelerate, respectively, during start/stop or setpoint changes.

The following can be set:
- acceleration time, 0.1 to 300 s
- deceleration time, 0.1 to 300 s.

The times apply to the acceleration from stop to rated speed and the deceleration from rated speed to stop, respectively.

At short deceleration times, the deceleration of the motor may depend on load and inertia as there is no possibility of actively braking the motor.

If the power supply is switched off, the deceleration of the motor will only depend on load and inertia.

![Ramp-up and ramp-down](image)

15.18 Communication

15.18.1 Pump number

You can allocate a unique number to the pump. This makes it possible to distinguish between pumps in connection with bus communication.

15.18.2 Enable/disable radio communication

You can set the radio communication to either enabled or disabled.
15.19 General settings

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>General settings</th>

</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>●</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>●</td>
</tr>
</tbody>
</table>

15.19.1 Language
A number of languages is available. Measuring units are automatically changed according to selected language.

15.19.2 Units
In this menu you can select between US and SI units. The setting can be made generally for all parameters or customized for each individual parameter.

15.19.3 Enable/disable settings
In this display, you can disable the possibility of making settings for protective reasons.

15.19.4 Delete history
In this menu you can delete the following historic data:
- Delete work log.
- Delete heat energy data.
- Delete energy consumption.

15.19.5 Define Home display
In this menu you can select whether the "Home" display should show various user-defined parameters or a graphical illustration of a performance curve with the actual duty point of the pump.

15.19.6 Display settings
In this menu you can adjust the display brightness and define whether or not the display should turn off if no buttons have been activated for a period of time.

15.19.7 Store actual settings
In this menu you can store the actual settings for later use.

15.19.8 Recall stored settings
In this menu you can recall the last stored settings that the pump will then use.

15.19.9 Run startup guide
The startup guide will guide you through the general settings of the pump.

16. Assist

16.1 Multi-pump setup

<table>
<thead>
<tr>
<th>Pump variant</th>
<th>Multi-pump setup</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPE3 (D)</td>
<td>●</td>
</tr>
<tr>
<td>TPE2 (D)</td>
<td>●</td>
</tr>
</tbody>
</table>

The multipump function enables the control of single-head pumps connected in parallel or twin-head pumps without the use of external controllers. The pumps in a multipump system communicate with each other via the wireless GENIair connection or the wired GENI connection.

You set up a multipump system via a selected pump, i.e. the master pump (first selected pump). You can connect all Grundfos pumps with a wireless GENIair connection to the multipump system.

The multipump functions are described in the following sections.

16.1.1 Alternating operation
Only one pump is operating at a time. The change from one pump to the other depends on time or energy. If a pump fails, the other pump will take over automatically.

Pump system:
- Twin-head pump.
- Two single-head pumps connected in parallel.

The pumps must be of the same type and size. Each pump requires a non-return valve in series with the pump.

16.1.2 Backup operation
One pump is operating continuously. The backup pump is operated at intervals to prevent seizing up. If the duty pump stops due to a fault, the backup pump will start automatically.

Pump system:
- Twin-head pump.
- Two single-head pumps connected in parallel.

The pumps must be of the same type and size. Each pump requires a non-return valve in series with the pump.

16.1.3 Cascade operation
Cascade operation ensures that the pump performance is automatically adapted to the consumption by switching pumps on or off. The system thus runs as energy-efficiently as possible with a constant pressure and a limited number of pumps.

When a twin-head pump is running in constant-pressure control mode, the second pump head will start at 90 % and stop at 50 % performance.

All pumps in operation will run at equal speed. Pump changeover is automatic and depends on energy, operating hours and fault.

Pump system:
- Twin-head pump.
- Two to four single-head pumps connected in parallel.

The pumps must be of the same type and size. Each pump requires a non-return valve in series with the pump.
- The control mode must be set to "Const. pressure" or "Const. curve".

Note: To unlock the pump and allow settings, press \ and \ simultaneously for at least 5 seconds.
## 17. Selection of control mode

<table>
<thead>
<tr>
<th>System application</th>
<th>Select this control mode</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Recommended for most heating systems, especially in systems with relatively large pressure losses in the distribution pipes.</strong> See description under proportional pressure. In replacement situations where the proportional-pressure duty point is unknown. The duty point has to be within the AUTO&lt;sub&gt;ADAPT&lt;/sub&gt; operating range. During operation, the pump automatically makes the necessary adjustment to the actual system characteristic. This setting ensures minimum energy consumption and low noise level from valves, which reduces operating costs and increases comfort.</td>
<td></td>
</tr>
</tbody>
</table>

| **The FLOW<sub>ADAPT</sub> control mode is a combination of AUTO<sub>ADAPT</sub> and FLOW<sub>LIMIT</sub>. This control mode is suitable for systems where you want a maximum flow limit, FLOW<sub>LIMIT</sub>. The pump continuously monitors and adjusts the flow, thus ensuring that the selected FLOW<sub>LIMIT</sub> is not exceeded. Main pumps in boiler applications where a steady flow through the boiler is required. No extra energy is used for pumping too much liquid into the system. In systems with mixing loops, you can use the control mode to control the flow in each loop. Benefits:** |
| - Enough water for all loops at peak load conditions if each loop has been set to the right maximum flow.  
- The dimensioned flow for each zone (required heat energy) is determined by the flow from the pump. This value can be set precisely in the FLOW<sub>ADAPT</sub> control mode without the use of pump throttling valves.  
- When the flow is set lower than the balancing valve setting, the pump will ramp down instead of losing energy by pumping against a balancing valve.  
- Cooling surfaces in air-conditioning systems can operate at high pressure and low flow. |

| **In systems with relatively large pressure losses in the distribution pipes and in air-conditioning and cooling systems.** |
| - Two-pipe heating systems with thermostatic valves and  
  - very long distribution pipes  
  - strongly throttled pipe balancing valves  
  - differential-pressure regulators  
  - large pressure losses in those parts of the system through which the total quantity of water flows (for example boiler, heat exchanger and distribution pipe up to the first branching).  
- Primary circuit pumps in systems with large pressure losses in the primary circuit.  
- Air-conditioning systems with  
  - heat exchangers (fan coils)  
  - cooling ceilings  
  - cooling surfaces. |

| **In systems with relatively small pressure losses in the distribution pipes.** |
| - Two-pipe heating systems with thermostatic valves and  
  - dimensioned for natural circulation  
  - small pressure losses in those parts of the system through which the total quantity of water flows (for example boiler, heat exchanger and distribution pipe up to the first branching) or  
  - modified to a high differential temperature between flow pipe and return pipe (for example district heating).  
- Underfloor heating systems with thermostatic valves.  
- One-pipe heating systems with thermostatic valves or pipe balancing valves.  
- Primary circuit pumps in systems with small pressure losses in the primary circuit. |
<table>
<thead>
<tr>
<th>System application</th>
<th>Select this control mode</th>

<td></td>
</tr>
<tr>
<td>• systems with three-way valves</td>
<td></td>
</tr>
<tr>
<td>• domestic hot-water circulation.</td>
<td></td>
</tr>
<tr>
<td>You can use $\text{FLOW}_\text{LIMIT}$ with advantage to control the maximum circulation flow.</td>
<td></td>
</tr>
</tbody>
</table>

If you install an external controller, the pump is able to change from one constant curve to another, depending on the value of the external signal. You can also set the pump to operate according to the maximum or minimum curve, like an uncontrolled pump:

- You can use the maximum curve mode in periods in which a maximum flow is required. This operating mode is for instance suitable for hot-water priority.
- You can use the minimum curve mode in periods in which a minimum flow is required. This operating mode is for instance suitable for manual night setback if you do not want Automatic Night Setback.

In systems requiring a constant flow, independently of pressure drop. Examples:

- chillers for air-conditioning
- heating surfaces
- cooling surfaces.

In systems requiring a constant tank level, independently of the flow rate. Examples:

- process water tanks
- boiler condensate tanks.

In systems with pumps operating in parallel. The multipump function enables the control of single-head pumps connected in parallel (two to four pumps) and twin-head pumps without the use of external controllers. The pumps in a multipump system communicate with each other via the wireless GENIair connection or the wired GENI connection.
18. Changing the position of the control panel

You can turn the control panel 180°. Follow the instructions below.

1. Loosen the four screws (TX25) holding the terminal box cover.

Fig. 65 Loosening the screws

2. Remove the terminal box cover.

Fig. 66 Removing the terminal box cover

3. Press and hold in the two locking tabs (pos. A) while gently lifting the plastic cover (pos. B).

Fig. 67 Lifting the plastic cover

4. Turn the plastic cover 180°.

Fig. 68 Turning the plastic cover

Note Do not twist the cable more than 90°.

5. Reposition the plastic cover correctly on the four rubber pins (pos. C). Make sure that the locking tabs (pos. A) are placed correctly.

Fig. 69 Re-positioning the plastic cover

6. Fit the terminal box cover, and make sure that it is also turned 180° so that the buttons on the control panel are aligned with the buttons on the plastic cover. Tighten the four screws (TX25) with 3.69 lbf-ft (5 Nm).

Fig. 70 Fitting the terminal box cover

TM05 5355 3612
TM05 5356 3612
The motor enables serial communication via an RS-485 input.
The communication is carried out according to the Grundfos GENIbus protocol and enables connection to a building management system or another external control system.
Via a bus signal, you can remote-set motor operating parameters, such as setpoint and operating mode. At the same time, the motor can, via the bus, provide status information about important parameters, such as actual value of control parameter, input power and fault indications.
Contact Grundfos for further information.

If you use a bus signal, the number of settings available via the Grundfos GO Remote will be reduced.

20. Priority of settings
You can always set the motor to operation at maximum speed or to stop with the Grundfos GO Remote.
If you enable two or more functions at the same time, the motor will operate according to the function with the highest priority.
Example: If, via the digital input, the motor has been set to maximum speed, the motor control panel or the Grundfos GO Remote can only set the motor to "Manual" or "Stop".
The priority of the settings appears from the table below:

<table>
<thead>
<tr>
<th>Priority</th>
<th>Start/stop button</th>
<th>Grundfos GO Remote or control panel on motor</th>

### Grundfos Eye Indication Description

- **No lights on.** Power off. Motor not running.
- **Two opposite green indicator lights rotating in the direction of rotation of the motor when seen from the non-drive end.** Power on. Motor running.
- **Two opposite green indicator lights permanently on.** Power on. Motor not running.
- **One yellow indicator light rotating in the direction of rotation of the motor when seen from the non-drive end.** Warning. Motor running.
- **One yellow indicator light permanently on.** Warning. Motor stopped.
- **Two opposite red indicator lights flashing simultaneously.** Alarm. Motor stopped.
- **The green indicator light in the middle flashes quickly four times.** Remote control with the Grundfos GO Remote via radio. The motor is trying to communicate with the Grundfos GO Remote. The motor in question is highlighted in the Grundfos GO Remote display to inform the user of the location of the motor.
- **The green indicator light in the middle flashes continuously.** When the motor in question is selected in the Grundfos GO Remote menu, the green indicator light in the middle will flash continuously. Press on the motor control panel to allow remote control and data exchange via the Grundfos GO Remote.
- **The green indicator light in the middle is permanently on.** Remote control with the Grundfos GO Remote via radio. The motor is communicating with the Grundfos GO Remote via radio connection.
- **The green indicator light in the middle flashes quickly while the Grundfos Go Remote is exchanging data with the motor. It will take a few seconds.** Remote control with the Grundfos GO Remote via infrared light. The motor is receiving data from the Grundfos GO Remote via infrared communication.
# 22. Signal relays

The motor has two outputs for potential-free signals via two internal relays.

The signal outputs can be set to "Operation", "Pump running", "Ready", "Alarm" and "Warning".

The functions of the two signal relays appear from the table below:

<table>

23. Maintenance and service

Warning
Before starting work on the pump, make sure that the power supply has been switched off for at least 5 minutes. Make sure that the power supply cannot be accidentally switched on.

Warning
Make sure that the escaping water does not cause injury to persons or damage to the equipment.

Warning
If the pump is used for a liquid which is injurious to health, it will be classified as contaminated. In such cases, the proper precautions must be taken to avoid injury to health when operating or working on the pump.

23.1 Maintenance

23.1.1 Pump
The pump is maintenance-free.
If the pump is to be drained for a long period of inactivity, inject a few drops of silicone oil on the shaft between the motor stool and the coupling. This will prevent the shaft seal faces from sticking.

23.1.2 Motor
The motor must be checked at regular intervals. It is important to keep the motor clean in order to ensure adequate ventilation.
If the pump is installed in a dusty environment, clean and check the pump regularly.

23.2 Service
If Grundfos is requested to service the pump, it must be cleaned before it is returned.
If proper cleaning is not possible, all relevant information about the pumped liquid must be provided.
If the above is not fulfilled, Grundfos can refuse to accept the pump for service.
Possible costs of returning the pump are to be paid by the customer.

23.2.1 Integral shaft/coupling
TPE2 and TPE3 pumps have integral shaft/coupling. We recommend that you do not remove the motor.
If the motor has been removed, it is necessary to remove the motor stool in order to refit the motor correctly. Otherwise the shaft seal may be damaged.

23.2.2 Blanking flanges
For twin-head pumps, a blanking flange with a pump housing gasket is available. See fig. 72.

Fig. 72 Fitting the blanking flange
If one pump requires service, the blanking flange is fitted to allow the other pump to continue operating.
24. Fault finding

**Warning**
*Before removing the terminal box cover or removing/dismantling the pump, make sure that the power supply has been switched off for at least 5 minutes. Make sure that the power supply cannot be accidentally switched on.*

**Warning**
*Make sure that the escaping water does not cause injury to persons or damage to the equipment.*

<th>Cause/remedy</th>
</tr>
</thead>
</table>
| 1. Motor does not run when started. | a) Supply failure.  
    b) Fuses blown.  
    c) Motor defective. |
| 2. Motor alarm when the power supply is switched on. | a) Supply failure.  
    b) Cable connection loose or faulty.  
    c) Motor winding defective.  
    d) Pump mechanically blocked. |
| 3. Occasional motor alarm. | a) Supply voltage periodically too low or too high.  
    b) Differential pressure across pump too low. |
| 4. No motor alarm, but the pump does not run. | a) Check the power supply.  
    b) Check fuses. |
| 5. Pump capacity not constant. | a) Pump inlet pressure too low.  
    b) Suction pipe/pump partly blocked by impurities.  
    c) Pump draws in air. |
| 6. Pump runs but delivers no water. | a) Suction pipe/pump blocked by impurities.  
    b) Foot or non-return valve blocked in closed position.  
    c) Leakage in suction pipe.  
    d) Air in suction pipe or pump. |
| 7. Pump runs backwards when switched off.* | a) Leakage in suction pipe.  
    b) Foot or non-return valve defective.  
    c) Foot or non-return valve blocked in open or partly open position. |
| 8. Leakage in shaft seal. | a) Shaft seal defective. |
    b) Pump does not rotate freely (frictional resistance) because of incorrect pump shaft position.  
    c) Resonance in the installation.  
    d) Foreign bodies in the pump. |

* In twin-head pump installations, the backup pump will often rotate slowly.
25. Megging

Megging of an installation incorporating MGE motors is not allowed, as the built-in electronics may be damaged.

26. Technical data, single-phase motors

26.1 Supply voltage

- 1 x 200-240 V - 10 %/+ 10 %, 60 Hz, PE.

Check that the supply voltage and frequency correspond to the values stated on the nameplate.

Recommended fuse size

<table>
<thead>
<tr>
<th>Motor size [hp (kW)]</th>
<th>Min. [A]</th>
<th>Max. [A]</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.25 - 1.0 (0.12 - 0.75)</td>
<td>6</td>
<td>10</td>
</tr>
<tr>
<td>1.5 - 2.0 (1.1 - 1.5)</td>
<td>10</td>
<td>16</td>
</tr>
</tbody>
</table>

You can use standard as well as quick-blow or slow-blow fuses.

26.2 Leakage current

Earth leakage current < 3.5 mA (AC supply).
Earth leakage current < 10 mA (DC supply).

The leakage currents are measured in accordance with EN 61800-5-1:2007.

27. Technical data, three-phase motors

27.1 Supply voltage

- 3 x 440-480 V - 10 %/+ 10 %, 60 Hz, PE.

Check that the supply voltage and frequency correspond to the values stated on the nameplate.

Recommended fuse size

<table>
<thead>
<tr>
<th>Motor size [hp (kW)]</th>
<th>Min. [A]</th>
<th>Max. [A]</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.25 - 1.5 (0.12 - 1.1)</td>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>2.0 - 3.0 (1.5 - 2.2)</td>
<td>6</td>
<td>10</td>
</tr>
</tbody>
</table>

Standard as well as quick-blow or slow-blow fuses may be used.

27.2 Leakage current

<table>
<thead>
<tr>
<th>Motor size [hp (kW)]</th>
<th>Leakage current [mA]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 - 3.0 (0.75 - 2.2) (supply voltage &lt; 400 V)</td>
<td>&lt; 3.5</td>
</tr>
<tr>
<td>1.0 - 3.0 (0.75 - 2.2) (supply voltage &gt; 400 V)</td>
<td>&lt; 5</td>
</tr>
</tbody>
</table>

The leakage currents are measured in accordance with EN 61800-5-1:2007.

28. Inputs/outputs

Ground reference (GND)

All voltages refer to GND.
All currents return to GND.

Absolute maximum voltage and current limits

Exceeding the following electrical limits may result in severely reduced operating reliability and motor life:

- Relay 1: Maximum contact load: 250 VAC, 2 A or 30 VDC, 2 A.
- Relay 2: Maximum contact load: 30 VDC, 2 A.
- GENI terminals: -5.5 to 9.0 VDC or < 25 mADC.
- Other input/output terminals: -0.5 to 26 VDC or < 15 mADC.

Digital inputs (DI)

- Internal pull-up current > 10 mA at V_i = 0 VDC.
- Internal pull-up to 5 VDC (currentless for V_i > 5 VDC).
- Certain low logic level: V_i < 1.5 VDC.
- Certain high logic level: V_i > 3.0 VDC.
- Hysteresis: No.
- Screened cable: 20-16 AWG (0.5 - 1.5 mm²).
- Maximum cable length: 1640 ft (500 m)

Open-collector digital outputs (OC)

- Current sinking capability: 75 mADC, no current sourcing.
- Load types: Resistive or/and inductive.
- Low-state output voltage at 75 mADC: Max. 1.2 VDC.
- Low-state output voltage at 10 mADC: Max. 0.6 VDC.
- Overcurrent protection: Yes.
- Screened cable: 20-16 AWG (0.5 - 1.5 mm²).
- Maximum cable length: 1640 ft (500 m)

Analog inputs (AI)

- Voltage signal ranges:
  - 0.5 - 3.5 VDC, AL AU.
  - 0-5 VDC, AU.
  - 0 - 10 VDC, AU.

Leak currents may occur at high operating temperatures. Keep the source impedance low.

Current signal ranges:

- 0-20 mADC, AU.
- 4-20 mADC, AL AU.
- Current signal: R_i = 292 Ω.

Current overload protection: Yes. Change to voltage signal.
Measurement tolerance: -0/+ 3 % of full scale (max.-point coverage).
Screened cable: 20-16 AWG (0.5 - 1.5 mm²).
Maximum cable length: 1640 ft (500 m) (excl. potentiometer).
Potentiometer connected to +5 V, GND, any AI:
- Use maximum 10 kΩ.
- Maximum cable length: 328 ft (100 m).
Analog output (AO)
Current sourcing capability only.
Voltage signal:
- Range: 0-10 VDC.
- Minimum load between AO and GND: 1 kΩ.
- Short-circuit protection: Yes.
Current signal:
- Ranges: 0-20 and 4-20 mADC.
- Maximum load between AO and GND: 500 Ω.
- Open-circuit protection: Yes.
Tolerance: - 0/+ 4 % of full scale (max-point coverage).
Screened cable: 20-16 AWG (0.5 - 1.5 mm²).
Maximum cable length: 1640 ft (500 m)

Pt100/1000 inputs (PT)
Temperature range:
- Maximum 356 °F (+180 °C) (168 Ω/1685 Ω).
Measurement tolerance: ± 2.7 °F (1.5 °C).
Measurement resolution: < 0.54 °F (0.3 °C).
Automatic range detection (Pt100 or Pt1000): Yes.
Sensor fault alarm: Yes.
Screened cable: 20-16 AWG (0.5 - 1.5 mm²).
Use Pt100 for short wires.
Use Pt1000 for long wires.

LiqTec sensor inputs*
Use Grundfos LiqTec sensor only.
Screened cable: 20-16 AWG (0.5 - 1.5 mm²).

Power supplies (+5 V, +24 V)
+5 V:
- Output voltage: 5 VDC - 5 %/+ 5 %.
- Maximum current: 50 mADC (sourcing only).
- Overload protection: Yes.
- Sensor.

+24 V:
- Output voltage: 24 VDC - 5 %/+ 5 %.
- Maximum current: 60 mADC (sourcing only).
- Overload protection: Yes.

Digital outputs (relays)
Potential-free changeover contacts.
Minimum contact load when in use: 5 VDC, 10 mA.
Screened cable: 20-12 AWG (0.5 - 2.5 mm²).
Maximum cable length: 1640 ft (500 m)

Bus input
Grundfos GENibus protocol, RS-485.
Screened 3-core cable: 20-16 AWG (0.5 - 1.5 mm²).
Maximum cable length: 1640 ft (500 m)

Enclosure class
Standard: IP55 (IEC 34-5).
Optional: IP66 (IEC 34-5).

Insulation class
F (IEC 85).

29. Other technical data
EMC (electromagnetic compatibility)
EN 61800-3.
Residential areas, unlimited distribution, corresponding to CISPR 11, class B, group 1.
Industrial areas, unlimited distribution, corresponding to CISPR 11, class A, group 1.
Contact Grundfos for further information.

</table>

29.2 Sound pressure level
The sound pressure level will be below 70 dB

30. Disposal
This product or parts of it must be disposed of in an environmentally sound way:
1. Use the public or private waste collection service.
2. If this is not possible, contact the nearest Grundfos company or service workshop.
The waste battery should be disposed of through the local collective services. If in doubt, contact your local Grundfos company.

Subject to alterations.
Appendix

1. Installation in the USA and Canada

In order to maintain the cURus approval, follow these additional installation instructions. The UL approval is according to UL 1004-1.

1.1 Electrical codes

For USA

This product complies with the Canadian Electrical Code and the US National Electrical Code.

This product has been tested according to the national standards for Electronically Protected Motors:

- CSA 22.2 100.04: 2009 (applies to Canada only).
- UL 1004-1: June 2011 (applies to USA only).

Pour le Canada

Codes de l’électricité

Ce produit est conforme au Code canadien de l’électricité et au Code national de l’électricité américain.

Ce produit a été testé selon les normes nationales s’appliquant aux moteurs protégés électroniquement:

- CSA 22.2 100.04: 2009 (s’applique au Canada uniquement).
- UL 1004-1: Juin 2011 (s’applique aux États-Unis uniquement).

1.2 Radio communication

For USA

This device complies with part 15 of the FCC rules and RSS210 of IC rules.

Operation is subject to the following two conditions:

- This device may not cause interference.
- This device must accept any interference, including interference that may cause undesired operation of the device.

Pour le Canada

Communication radio

Ce dispositif est conforme à la partie 15 des règles de la FCC et aux normes RSS210 de l’IC.

Son fonctionnement est soumis aux deux conditions suivantes:

- Ce dispositif ne doit pas provoquer de brouillage préjudiciable.
- Il doit accepter tout brouillage reçu, y compris le brouillage pouvant entraîner un mauvais fonctionnement.

1.3 Identification numbers

For USA

Grundfos Holding A/S

Contains FCC ID: OG3-RADIOM01-2G4.

For Canada

Grundfos Holding A/S

Model: RADIOMODULE 2G4

Contains IC: 10447A-RA2G4M01.

Pour le Canada

Numéros d’identification

Grundfos Holding A/S

Modèle: RADIOMODULE 2G4

Contient IC: 10447A-RA2G4M01.

1.4 Electrical connection

1.4.1 Conductors

Use 140/167 °F (60/75 °C) copper conductors only.

1.4.2 Torques

Maximum tightening torques for the terminals can be found in section 29.1 Torques, page 50.

1.4.3 Line reactors

Maximum line reactor size must not exceed 1.5 mH.

1.4.4 Fuse size/circuit breaker

If a short-circuit occurs, the pump can be used on a mains supply delivering not more than 5000 RMS symmetrical amperes, 600 V maximum.

<table>
<thead>
<tr>
<th>Motor size [hp (kW)]</th>
<th>Fuse size</th>
<th>Circuit breaker type/model</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.50 to 3.0 (0.25 to 2.2)</td>
<td>25 A</td>
<td>25 A / inverse time</td>
</tr>
</tbody>
</table>

Fuses

When the motor is protected by fuses, they must be rated for 480 V. Maximum sizes are stated in the table above.

Motors up to and including 3.0 hp (2.2 kW) require class K5 UR fuses.

Circuit breaker

When the pump is protected by a circuit breaker, this must be rated for a maximum voltage of 480 V. The circuit breaker must be of the “inverse time” type.

The interrupting rating (RMS symmetrical amperes) must not be less than the values stated in the table above.

1.4.5 Overload protection

Degree of overload protection provided internally by the drive, in percent of full-load current: 102 %.

Subject to alterations.
Appendix

US: Inlet pressure stated in bar relative pressure (pressure gauge value measured on the suction side of the pump)
